PUSH PIER SYSTEMS

PPB-400 PPB-350 PPB-300 PPB-250 WALL MOUNT

Designed and Engineered to Perform

STEEL PUSH PIERS:

noun

\ 'stēl \ push \ 'pir \

to strengthen, reinforce, and stabilize a structure

Steel Push piers are driven deep into the soil to lift and support sinking foundations

FOUNDATION REPAIR

If you notice cracked floors or misaligned windows, you may have foundation issues. ECP offers foundation repair products, such as steel piers and helical piers, to stabilize your foundation. Our products are designed to lift and support sinking foundations back to normal.

WHY FOUNDATIONS SETTLE

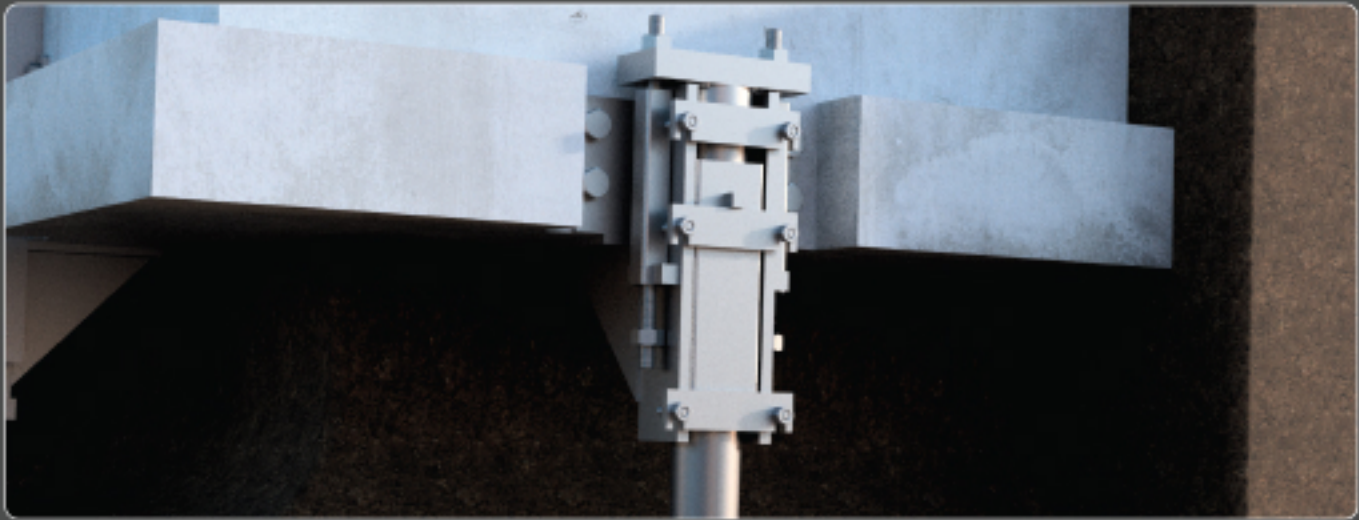

- Weak bearing soil / Poorly compacted soil
- Dry or Hot weather conditions
- Tree Roots and Vegetation
- Plumbing leaks
- Improper gutters that don't redirect water efficiently
- Grading Problems

ECP'S FOUNDATION SETTLEMENT SOLUTIONS

ECCENTRIC PIERS

PPB-400 • PPB-350 • PPB-300 • WALL MOUNT

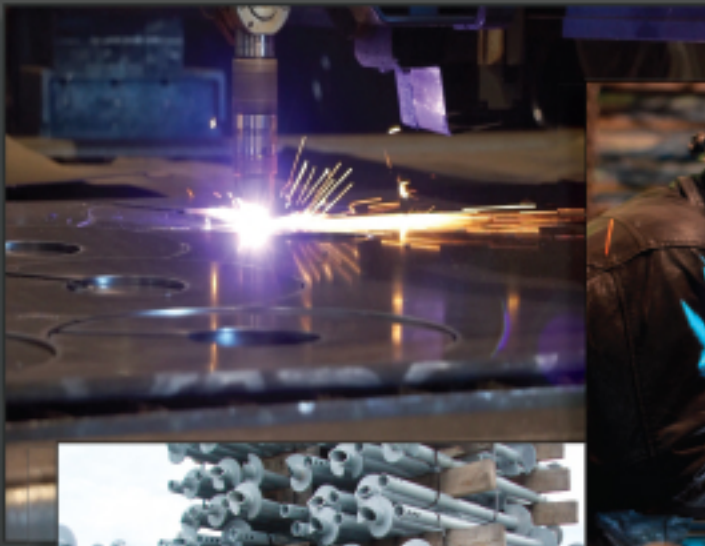

ECP's Push Pier system consists of galvanized or non galvanized steel brackets that are mounted to the bottom of your foundation. Using a hydraulic ram galvanized steel pipe is driven to the load bearing strata by using the weight of the structure. To complete the lift ECP's Push Piers are connected to a hydraulic manifold system to put the foundation back to its original state.

CONCENTRIC PIERS

ECP's Concentric Pier System allows the pier to be used directly under a load-bearing wall or beam. The pier is driven hydraulically to load-bearing strata by using the weight of the structure. As with all ECP Piers, Concentric Piers are connected to a hydraulic manifold system for your lift.

HOURS OF OPERATION:

Open Monday – Saturday 8:00-5:00

Saturday 8:00-2:00

Closed Sunday

Sunday by appointment only
